This is the nucleotide sequence of cDNA clone DNA44176 (ATCC 209532) coding for human PRO347 (UNQ306) (see AAY06482). The clone was isolated from a foetal kidney library. Amplification of DNA44176 occurs in various tumours, suggesting an association with tumour formation or growth. Antagonists (e.g. antibodies) directed against PRO347 may have use in cancer therapy. The invention identifies 14 genes (see AAX87254-67) that are amplified in the genome of tumour overexpression of the gene product and to contribute to tumour discoverexpression of the gene product and to contribute to tumour discoverexpression of the gene product and to contribute to tumour approach for the diagnosis and/or treatment (including prevention) of certain cancers, and may act as predictors of the prognosis of
                                                                                                                                                                                                      Antibody against proteins expressed in neoplastic cells, useful for tumor diagnosis and treatment
                                                                                                Lawrence DA;

Human T139 nucleic acids and polypeptides, useful for treating proliferative disorders associated with aberrant T139 expression or activity

Claim 2; Page 114; 115pp; English.

This represents the coding sequence of the human T139 polypeptide. The T139 polypeptide can be expressed by standard recombinant methodology. The T139 cDNA insert is deposited with AprC under accession number of the T139 polypeptides and polynucleotides can be administered 98644. The T139 polypeptides and polynucleotides can be administered therapeutically or prophylactically to treat/prevent disorders associated with aberrant T139 expression or activity, especially proliferative or differentiative disorders, e.g. as a contraceptive to decrease sociated modulate spermatogenesis, e.g. as a contraceptive to decrease contractogenesis or to treat disorders related to defects in sperm-egg fusion. They may also be useful to treat testicular disorders e.g. testicular cancer. The polypeptides may be used to identify selectively binding compounds which may be useful for detecting the polypeptide activity. The polynucleotides medulating polypeptide activity. The selectively hybridize to the polynucleotides which may be useful for detecting the polynucleotides in a sample, gene mapping; identifying cells or tissues expressing aberrant T139 levels; determining if a gene calls or tissues expressing aberrant T139 levels; determining if a gene calls or tissues expressing aberrant T139 levels; determining if a gene calls or tissued with T139 expression a activity and to monitor therapeutic interventions; and for producing antisense sequences for therapeutic administration to modulate/prevent T139 expression.
